Drifting data: 200,000 old + 100,000 new vectors, 100 clusters in 64 dimensions, 1000 report queries
(a) Recall
recall@10 at the fixed setting
shift (units of a vector's distance to its cluster centre)
(b) Speed (queries per second)
speed relative to the same index at shift 0
shift (units of a vector's distance to its cluster centre)
(c) IVF: vectors scanned per query
vectors scanned per query
identical for IVF-Flat and IVF-PQ
shift (units of a vector's distance to its cluster centre)
(d) IVF-PQ: how badly the codes fit the new vectors
squared PQ error, new vectors
error on the old vectors
shift (units of a vector's distance to its cluster centre)
HNSW
IVF-Flat
IVF-PQ
stale (old build + new vectors added)
retrained / rebuilt on all vectors
